Device.CreateCapturerequest (cameradevice.template_still_capture) singlerequest.addtarget (imreadersurface) sessÄ.capture (singlerequest.build () , null, null) There is a drawback with this approach, however: you don't know exactly when the Single Request occurs. You can't use the Camera to create a camera, which will be specific to that camera. Once you have chosen a template, you do not need to provide one or more SAN destination buffers to use ää This is essential, for example, when doing InstantVideo scans to maintain a seasonal frame rate. We recommend using the Jetpack Camera Library, except when your use box requires access to specific features available only in Camera 2. If a pipeline cannot keep up with the received frames, it will be able to leave them. To create a capture request, you cannot use one of the predefined templates, or you cannot use the Template Manual for full control. In many cases, additional basebacks, such as ImageReader.OnimageAVailAllelistener, can also be triggered once the contained frame has been processed. // From CameradeVice.createCapturerequest (), this will continue sending the most frequent possible capture request until the session // is dropped or stoprepeating() A© session.setrepeatingRequest (Capturerequest.Build (), null, null) A repeat capture request that the camera device continuously captures images using the settings µ on the provided Capturerequest. You should not do this before you eat using the Camera so that the structure can configure the pipelines of the device and allocate ³ buffers to send frames to the desired sa targets. RenderScript.Find if Want to do parallel processing Val Surfaceview = FindViewById (...) Val ImageReader = ImageReader.NewinStance (...) // Remember to call this only * After * Surfaceholder.Callback.surfacecreated () Val Previewurface = Surfaceview .Holder.Surface Val ImReadersurface = ImageReader.Surface Val Targets = ListOf (Previewurface, Imreadersurface) // Create a capture session using the predefined targets; This also involves setting Callback session // Callback status to be notified when session is ready Cameradevice.CreateCaptureSession (Targets, Object: CameracaptureSession.statecallback () {Override Fun OnConfigured (Session: CameracaptureSession) {} // Doing something with `session` } // omit for brevity ... Note: This page uses the Camera2 Classes. Surfaceview, if you want to display the image directly to the user // 2. , to create a request Simple capture for a surfaceview using the template designed for non-modifications, use cameradevice.template_preview: Val Session: CameracaptureSession = ... The following shows how to add a repeated request to Session: Val Session: CameracaptureSession = ... Android Framework knows how to convert a gross image into the active configuration in an appropriate format for each destination. Note that the repeated requests have a priority lower than the requests Single-frame or burst , which allows the following sample to work: Val Session: CameracaptureSession = ... The Framework provides warranties for specific combinations of device parameters, surface and request. Flows act as parallel pipelines that process gross frames that come out of the camera, a frame at a time: Figure 1. Capture requests use a builder pattern and offer developers the opportunity to define many options Different, including automotive exposure, automotive focus and lens opening. Both camerax and work on Android 5.0 (API level 21) and higher. Due to hardware constraints, only a single configuration can be elgniS tseuqeRerutpaC gnitaepetR .enilepip a stneserper reffub hcaeE .3 // sisylana emarf-yb-earmf mroftrep ro emarf hcae daer ot tnaw uoy fi .redaeRegamI .egami war eht eviecer lliw taht senilepip tuputo fo tes dna noitarugifnoc evitca eht egnahc nac tseuqer hca = tseuqe RerutpaC :tseuqeRerutpac lav kcabllaCetatS.noisseSerutpaCAREMAc morf // .tegrat tuputo sÄ A erom .eno stceles dna eueuq eht ot noitarugifnoc a sdda tseuqeRerutpaC A .ecafruS a eb tsum hcihw ,tegrat hcae fo epyt eht yb denimreted si reffub rieht ot nettirw era yeht sa stupni ot delipna noitamrofsnart eht .esele gnihtems ro ,UPG ,UPC eht morf rewop gnissecorp elbaliava eht eht no gnidneped still namroftrep eb dluoc ereht taht seilpmi gnissecorp lellaraP)81Ä sa hcus setubirtta aremac seificeps noitarugifnoc eht T .tseuqer eht gnidiub erofeb)ecafruSweiverp(tegratTdda.tseuqeRelgnis da dluow uoy ,evoba edoc eht nl .B tseuqer ot A tseuqer morf tegrat tuputo eht dda .melborp siht etagitim ot od nac uoy sgniht emos era ereht .ecafruS alucitrap eht fo ezis dna tamrof lexip eht yb dellortnoc si noisrevnoc eht T .taht od ot tseuqer erutpac hctapsid dna etaerc nac uoy ,derugifnoc neeb sah noisses eht ecnO .eciveDaremaC eht ot dnuob senilepip elbissop eht lla sebircsed noisseSerutpaCAREMAc A .noitarugifnoc prevents s'areht denifed ton evah uoy tniop siht ta taht etoN repoolL s'daerht tnerucc ot kcab sllaf ,reldnaH a htiw decalper eb nac llun // llun ,) tinU =)noisseSerutpaCAREMAc .noisses(deliaFerugifnocCno nuf edirrevo .noitarugifnoc evitca eht deliac si noitarugifnoc siht ,emit nevig yna ta rosnes aremac eht ni Requests are easy to make, but to display a live view they are not very useful. Any output target buffer used must have been configured as part of the camera session when the session was first created. // from Camera.Device.createCaptureRequest () // The first null argument corresponds to the capture callback, which you must // provide if you want to retrieve frame metadata or keep track of failed capture // requests that may indicate dropped frames; the second argument null // corresponds to the Hand used by the asynchronous callback, which will drop // back into the current thread looper if null session.capture (captureRequest.Build (), null, null) When an output frame is placed in the target buffer (s), a capture callback is triggered. There are no guarantees for the latency between the last repeated request of A before request B is activated and the next time A is being used again, so you can try some skipped frames. You can send many capture requests over the life of a capture session. To create a camera session, provide it with one or more output target buffers for which the app can record output frames. Use a combination of models designed to work for that particular scenario, such as zero-shutter-lag. The CameraCaptureSession maintains a queue of CaptureRequests, which become the active configuration. Before defining a field, verify that the device-specific option is available by calling CameraCharacteristics.getAvailableCaptureRequestKeys () and that the desired value is supported by checking the appropriate camera feature, such as auto exposure modes available. The documentation for createCaptureSession () provides more information. // from CameraCaptureSession.StateCallback // Create the repeated request and send it = = CameradeVice.template_preview) RepeaterRequest.addtarget (PreviewUrface) Session.setrepeatingRequest (RepeatingRequest.Build (), null, null) // Sometime later ... Issue a capture request without repeating, while the repeat request continues to be executed. In this case, you would not need to receive a contNonFrame stream, not just a single one. A single Android device can have multiple cameras. Photographic machines.
